AB Ion exchange resins selective for the sequestration of Fe³⁺ from aqueous
solns. containing citrate were prepared by the mol. imprinting technique.
Sorption characteristics of imprinted resins prepared with high (85 mol%)
and low (3 mol%) amts. of covalent crosslinking were examined Expts. to
determine loading capacity and selectivity, relative to several metal ions of
physiol. significance, were performed. The Fe³⁺ capacity of the highly
cross-linked resin was larger but the selectivity was lower.

DOCUMENT TYPE: Conference; Meeting Abstract
LANGUAGE: English

AB Mol. imprinting is a useful technique for making a chemical selective binding site. The method involves building a synthetic polymeric scaffold of mol. compliments containing the target mol. with subsequent removal of the target to leave a cavity with a structural "memory" of the target. Incorporation of a reporting group as part of the imprinting site would generate a sensor from the molecularly imprinted polymer. Hence, we have developed a sensor based on lanthanide luminescence for sensing compds. that contain phosphonate moieties. The chemical modification of sensitizing ligands, the challenges involved in their incorporation into molecularly imprinted polymers, their spectroscopic characterization and selectivity will be discussed.

AB Inn this study, we present ≈ 1 yr (Oct. 1998-Sept. 1999) of 12-h mean NH_3 , NH_4^+ , HCl , Cl^- , NO_3^- , HNO_3 , HONO , SO_4^{2-} , and SO_2 concns. measured at an agricultural site in North Carolina's Coastal Plain region. Mean gas concns. were 0.46, 1.21, 0.54, 5.55, and 4.15 $\mu\text{g m}^{-3}$ for HCl , HNO_3 , HONO , NH_3 , and SO_2 , resp. Mean aerosol concns. were 1.44, 1.23, 0.08, and 3.37 $\mu\text{g m}^{-3}$ for NH_4^+ , NO_3^- , Cl^- , and SO_4^{2-} , resp. NH_3 , NH_4^+ , HNO_3 , and SO_4^{2-} exhibit higher concns. during the summer, while higher SO_2 concns. occur during winter. A meteorol.-based multivariate regression model using temperature, wind speed, and wind direction explains 76% of the variation in 12-h mean NH_3 concns. ($n = 601$). NH_3 concentration increases exponentially with temperature, which explains the majority of variation (54%) in 12-h mean NH_3 concns. Dependence of NH_3 concentration on wind direction suggests a local source influence. NH_3 accounts for $>70\%$ of NH_x ($\text{NH}_x = \text{NH}_3 + \text{NH}_4^+$) during all seasons. Ammonium nitrate and sulfate aerosol formation does not appear to be NH_3 limited. Sulfate is primarily associated ammonium sulfate, rather than bisulfate, except during the winter when the ratio of $\text{NO}_3^-/\text{NH}_4^+$ is ≈ 0.66 . The annual average $\text{NO}_3^-/\text{NH}_4^+$ ratio is ≈ 0.25 .

TITLE: Molecularly imprinted permeable membrane for uranyl ion.

AUTHOR(S): Kimaro, Anael; Kelly, Lisa; Murray, George

CORPORATE SOURCE: Department of Chemistry & Biochemistry, University of Maryland, Baltimore, MD, 21250, USA
 SOURCE: Abstracts of Papers, 220th ACS National Meeting, Washington, DC, United States, August 20-24, 2000 (2000), IEC-050. American Chemical Society: Washington, D. C.
 CODEN: 69FZC3
 DOCUMENT TYPE: Conference; Meeting Abstract
 LANGUAGE: English

AB An ion permeable membrane selective for uranyl ion has been prepared by employing the mol. imprinting technique. Uranyl vinylbenzoate complex when copolymd. with styrene in the presence of crosslinkers, porogens and plasticizers was formed as a thin membrane. Removal of the uranyl ion template by washing with acid created cavities suitable for the selective complexation of uranyl ions. A linear polymeric porogen was used to create channels in the polymer allowing permeation of uranyl ion across the membrane. The imprinted membrane exhibits good loading capacity so that transport of uranyl ions through the membrane is facilitated. The polymer membrane provides selective permeation of uranyl ions in the presence of multiple interferences. Quiescent solution diffusion has been measured with fluxes up to 0.82 nmol/cm² h for uranyl ion transport. The phys. stability of the membrane qualifies it for practical application in separation of industrial wastes.

PATENT NO.	KIND	DATE	APPLICATION NO.	DATE
US 377084 A		18880131	US	18870312

AB To all whom it may concern: Be it known that I, GEORGE H. MURRAY, a citizen of the United States, residing at Chicago, county of Cook, and State of Illinois, have invented certain new and useful Improvements in Fertilizing Compounds, which are fully set forth in the following specification. The purpose of this invention is to utilize distillery-slop and animal excrement in the manufacture of a fertilizer, which shall be handled in the form of a dry powder or granular mass in convenient form for application in gardening and farming. I find the two substances-animal excrement from grain-fed animals and distillery-slop-to be substantially equivalents for this purpose, since both are the undigested and indigestible residuum of the grain. The principal feature of this invention consists in the use of tan-bark-that is to say, bark which has been employed for the purpose of tanning leather-as the principal substance for absorbing the elements of vegetable nutrition and stimulus from the other substances which enter into the compound, said tan-bark being the principal vehicle for carrying the other substances, although doubtless itself containing some elements adapted to stimulate the growth of the plants to which the compound is applied. I employ as the elements of my fertilizer-besides distillery-slop or animal excrement and tan-bark-salt, slaked lime, and potash.

AB A molecularly imprinted polymer ion exchange resin for selectively removing one or more inorganic ions in a liquid medium is disclosed and described. The exchange resin can include a bead having a porous structure and comprising a cross-linked molecularly imprinted polymer having molecular sized cavities adapted to selectively receive and bind a specific inorganic ion in a liquid medium. A process for preparing a molecularly imprinted polymer ion exchange resin can include (a) polymerizing a polymerizable mixture in the presence of an inorganic ion imprinting complex to form a bead, said inorganic ion imprinting complex including a ligand and an inorganic ion; and (b) removing the inorganic ions from the bead to form the molecularly imprinted polymer ion exchange resin, the bead having a porous structure and comprising a cross-linked molecularly imprinted polymer having molecular sized cavities adapted to selectively receive and bind a specific inorganic ion in a liquid medium.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB	Authenticatable products are manufactured by (a) complexing a lanthanide			

complex of a β -ketone containing a chain-transfer moiety with a target analyte and (b) polymerizing the adduct with a monomer and a crosslinking agent. A typical product was manufactured by complexing 1-[4-(4,4,4-trifluoro-1,3-dioxo-1-butyl)-1-naphthyl]ethyl dithiobenzoate with $\text{EuCl}_3 \cdot 6\text{H}_2\text{O}$, radically polymerizing 1-but-3-enyl-4-vinylbenzene in the presence of the resulting complex and di-Me hydrogen phosphate (analyte), polymerizing styrene in the presence of the 2nd complex, and crosslinking.

AB A molecularly imprinted polymer ion exchange resin for selectively removing one or more inorganic ions in a liquid medium is disclosed and described. The exchange resin can include a bead having a porous structure and comprising a cross-linked molecularly imprinted polymer having molecular sized cavities adapted to selectively receive and bind a specific inorganic ion in a liquid medium. A process for preparing a molecularly imprinted polymer ion exchange resin can include (a) polymerizing a polymerizable mixture in the presence of an inorganic ion imprinting complex to form a bead, said inorganic ion imprinting complex including a ligand and an inorganic ion; and (b) removing the inorganic ions from the bead to form the molecularly imprinted polymer ion exchange resin, the bead having a porous structure and comprising a cross-linked molecularly imprinted polymer having molecular sized cavities adapted to selectively receive and bind a specific inorganic ion in an liquid medium.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Molecularly imprinted polymers (MIPs) were grafted successfully from the surface of silica gel particles via surface initiated reversible addition-fragmentation chain transfer (RAFT) polymerization using RAFT agent functionalized silica gel as the chain transfer agent. The intrinsic characteristics of the controlled/living polymerization mechanism of RAFT allowed for the effective control of the grafting process. Thus the grafting copolymn. of methacrylic acid and divinyl benzene in the presence of template theophylline led to thin MIP film coating silica gel (MIP-Silica). The thickness of MIP film prepared in this study is about 1.98 nm, which was calculated from the nitrogen sorption anal. results. Measured binding kinetics for theophylline to the MIP-Silica and MIPs prepared by conventional bulk polymerization demonstrated that MIP-Silica had improved mass-transfer properties. In addition, the theophylline-imprinted MIP-Silica was used as the sorbent in solid-phase extraction to determine theophylline in blood

serum with satisfactory recovery higher than 90%. Nonspecific adsorption of interfering compds. can be eliminated by a simple elution with acetonitrile, without sacrificing the selective binding of theophylline.

 AB In this paper, we present a general protocol for the making of
 surface-imprinted core-shell nanoparticles via surface reversible
 addition-fragmentation chain-transfer (RAFT) polymerization
 using RAFT agent functionalized model silica nanoparticles as
 the chain-transfer agent. In this protocol,
 trichloro(4-chloromethylphenyl)silane was immobilized on the surface of
 SiO2 nanoparticles, forming chloromethylphenyl functionalized silica
 (silica-Cl). RAFT agent functionalized silica was subsequently produced
 by substitute reaction of silica-Cl with PhC(S)SMgBr. The grafting
 copolym. of 4-vinylpyridine and ethylene glycol dimethacrylate using
 surface RAFT polymerization and in the presence of 2,4-dichlorophenoxyacetic

acid
 as the template led to the formation of surface-imprinted core-shell
 nanoparticles. The resulting surface-imprinted core-shell nanoparticles
 bind the original template 2,4-D with an appreciable selectivity over
 structurally related compds. The potential use of the surface-imprinted
 core-shell nanoparticles as the recognition element in the competitive
 fluorescent binding assay for 2,4-D was also demonstrated.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB A process is provided herein for preparing molecularly imprinted polymers for detecting a target analyte by Reversible Addition Fragmentation Chain Transfer (RAFT). The process includes providing a complex having the formula L^*M wherein L is a β -diketone ligand containing a chain transfer moiety and L^* can be the same or different ligands, and M is a lanthanide element; reacting the complex with the target analyte to provide an adduct containing the target analyte; co-polymerizing the adduct with a monomer and cross-linking agent to provide a polymer; and, removing the target analyte from the polymer to provide the molecularly imprinted polymer.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Cu-catalyzed 1,3-dipolar cycloaddn. reactions were utilized to access a novel monomer, 2-methyl-acrylic acid 1-(7-diethylamino-2-oxo-2H-chromen-3-yl)-1H-[1,2,3] triazol-4-ylmethyl ester (CTEMA), with mild reaction conditions and high yield. The RAFT copolymn. of CTEMA with Me methacrylate (MMA) showed the features of "living"/controlled radical polymerization Polymeric europium complexes were successfully prepared by the reaction between copolymers and pre-complexed europium. The weight percent of the Eu(III) ion in the polymer (Eu%) reached up to 29.5%. The polymeric europium complexes displayed different fluorescent profiles using different excitation wavelengths.

AB Two comb-like copolymers (BIMT and PMB) composed of N-2-thiazolylmethacrylamide (NTMA) and 2-(1-butylimidazolium-3-yl) Et methacrylate tetrafluoroborate (BIMA) were prepared by free radical polymerization

and reversible addition-fragmentation chain transfer (RAFT) polymerization. The monomer conversion was confirmed by FTIR spectra and ¹H NMR spectra. The metal (Ni²⁺, Nd³⁺) complexes of these two copolymers were prepared, and the magnetic properties of the complexes were studied. The coordinated complexes display three possible chelating structures, based on nitrogen donor and oxygen donor ligands and the kinds of the metal ions. The bimetallic complexes (BIMT-Nd-Ni and PMB-Nd-Ni) were synthesized by using the different coordination sites of the polymers. The magnetic properties of the complexes show different structures arising from different preparation routes; the kind and content of metal ions and the state of the complexes can affect exchange interactions between metal ions and induce magnetic phenomena.

AB A novel monomer containing pyridylazo-2-naphthoxyl group, 1-(1-(4-vinylbenzyloxy)naphthalen-2-yl)-2-(pyridin-2-yl)diazene (VBNPA), was successfully synthesized and copolyd. with styrene (St) in N,N-DMF (DMF) via reversible addition-fragmentation chain transfer (RAFT)

polymerization

using 2-cyanoprop-2-yl-1-dithionaphthalate (CPDN) as RAFT agent. The polymerization behavior exhibited "living"/controlled characters. The obtained copolymer, poly(St-co-VBNPA), with pre-determinable mol. weight and narrow mol. weight distribution can be used as the carrier in metal ion detection and anal. via pre-concentration technique. The copolymer-metal ion (copper (Cu)

and

europium (Eu)) complexes were prepared and characterized.

 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB Soluble molecularly imprinted polymers (MIPs) were prepared by reversible
 addition
 fragmentation chain transfer (RAFT) polymerization followed by
 ring-closing metathesis (RCM). The polymerization was done in the presence of

a
 template to generate a processable star MIP. The core of the star polymer
 was a dithiobenzoate-substituted tris(β -diketonate) europium
 (III) complex. The tris(β -diketonate) europium
 (III) complex served as a polymerization substrate for the three-armed
 RAFT-mediated star polymer and as a luminescent binding site for
 dicotrophos, an organophosphonate pesticide. The star arms were AB block
 copolymers. Block A was either 1-but-3-enyl-4-vinylbenzene or a mixture of
 1-but-3-enyl-4-vinylbenzene and styrene. Block B was styrene or Me
 methacrylate. The but-3-enyls of block A were reacted by RCM with a
 second generation Grubbs catalyst to give an intramolecularly cross-linked
 core. The intramolecularly cross-linked MIP was soluble in common organic
 solvents. The 30% cross-linked soluble and processable star MIP was applied
 to the determination of dicotrophos with sub-ppb level detection limits.

 DOCUMENT TYPE: Journal
 LANGUAGE: English
 AB Molecularly imprinted polymers capable of sensing organophosphorous
 compds. by luminescence were prepared by reversible addition fragmentation
 chain transfer (RAFT) polymerization. The polymer contained a
 dithiobenzoate substituted tris(β -diketonate) europium(III)
 complex which served as a polymerization substrate and as a luminescent
 binding site for pinacolyl methylphosphonate (PMP), the hydrolysis product
 of the nerve agent Soman. The resultant polymer allowed quantitation of
 PMP in the low ppb range with minimal interference from similar compds.
 Polymers were characterized by luminescence spectroscopy and SEM.

AB Targeted therapeutic delivery systems comprising specially designed nanocarriers for intracellular therapeutic delivery, mediated by acoustic energy, for use either in vivo or in vitro, are described. Nanocarriers comprised of substantially peptosomes, and mixtures thereof, are used to treat a variety of diseases in humans and other species, such as cancer, ophthalmological, pulmonary, urinary or other pathologies. Methods for preparing the targeted therapeutic delivery systems are also embodied, which comprise processing a solution comprised of biopolymers or other species and components, with or without targeting moieties, adding said biopolymers and other compounds to a solution containing one or more therapeutic agents, stabilizing or not stabilizing said nanocarriers, adding one or more contrast agents, and resulting in a targeted therapeutic delivery system. Preferred therapeutics for use with the present invention include nucleic acids, proteins, peptides, and other therapeutic macromolecules.

<p>AB Authenticatable products are manufactured by (a) complexing a lanthanide complex of a β-ketone containing a chain-transfer moiety with a target analyte and (b) polymerizing the adduct with a monomer and a crosslinking agent. A typical product was manufactured by complexing 1-[4-(4,4-trifluoro-1,3-dioxo-1-butyl)-1-naphthyl]ethyl dithiobenzoate with $\text{EuCl}_3 \cdot 6\text{H}_2\text{O}$, radically polymerizing 1-but-3-enyl-4-vinylbenzene in the presence of the resulting complex and di-Me hydrogen phosphate (analyte), polymerizing styrene in the presence of the 2nd complex, and crosslinking.</p>

AB A process is provided herein for preparing molecularly imprinted polymers for detecting a target analyte by Reversible Addition Fragmentation Chain Transfer (RAFT). The process includes providing a complex with the following formula L3M wherein L is a β -diketone ligand containing a chain transfer moiety and L3M can be the same or different ligands, and M is a lanthanide element; reacting the complex with the target analyte to provide an adduct containing the target analyte; co-polymerizing the adduct with a monomer and crosslinking agent to provide a polymer; and, removing the target analyte from the polymer to provide the molecularly imprinted polymer.

FILE COVERS U.S. PATENTS 1790-1975

Produced using data provided by Univentio.

This database was created using Optical Character Recognition (OCR) technology. For this reason, some characters may be missing or mistranslated. In order to improve searchability and retrieval, CA indexing information has been added to the Title, Inventor, and Patent Assignee fields where possible. Please see HELP CASDATA for more information on the availability of CAS indexing in this database.

USPATOLD now includes complete International Patent Classification (IPC) reclassification data for the third quarter of 2009.

CAS Information Use Policies apply and are available at:

<http://www.cas.org/legal/infopolicy.html>

This file contains CAS Registry Numbers for easy and accurate substance identification.

The ALL, BIB, MAX, and STD display formats in the CA/CASplus family of databases have been updated to include new citing references information. This enhancement may impact record import into database management software. For additional information, refer to NEWS 9.
